UNIVERSITY OF EDINBURGH

COLLEGE OF SCIENCE AND ENGINEERING

SCHOOL OF INFORMATICS

INFORMATICS 1 - OBJECT-ORIENTED PROGRAMMING

Thursday $6^{\frac{th}{2}}$ May 2010

14:30 to 16:30

Convener: J Bradfield External Examiner: A Preece

INSTRUCTIONS TO CANDIDATES

- 1. Note that ALL QUESTIONS ARE COMPULSORY.
- 2. DIFFERENT QUESTIONS MAY HAVE DIFFERENT NUMBERS OF TOTAL MARKS. Take note of this in allocating time to questions.

1. In each of parts (a)-(c) below, you will be asked to supply the body to a method inside a class. There will be a separate class for each part, named OneA, OneB and OneC respectively. You will be given a skeleton file for each of these classes, and the skeleton will contain the appropriate method declaration. You should add your definitions of the methods at the points marked as follows:

// ADD CODE HERE

(a) Implement the method boolean outOfRange(int[] a, int b, int c) in the class OneA (skeleton file supplied). Given an array of ints, a, and two limits, b and c, this method should return true if and only if every element e of the array is strictly outwith the limits; that is, e is less than b or greater than c. You can assume that the array a contains at least one element, and that b ≤ c.

Expected behaviour:

```
outOfRange(new int[] {1, 2, 5, 6, 7}, 3, 4) -> true
outOfRange(new int[] {1, 2, 3, 4, 5}, 3, 4) -> false
outOfRange(new int[] {1, 8, 7, 6, 9, 9}, 2, 5) -> true
outOfRange(new int[] {3, 5, 4, 3}, 2, 6) -> false
```

[15 marks]

(b) Implement the method int[] ignoreRange(int[] a, int i, int j) in the class OneB. Given an array of ints, a, and two *indexes* into the array, i and j, this should return an array with a copy of the elements that lie strictly outwith the two indexes. For example, if a is {4, 3, 2, 5}, and i is 1 and j is 2, then the elements outside the indexes will be a[0] (i.e., 4) and a[3] (i.e., 5). Every element inside the indexes should instead contain -1.

Expected behaviour:

[15 marks]

(c) Implement the method int[] duplicate(int[] a, int b) in the class OneC. Given an array of ints, a, and an int b, this method should return a new array which is the same as a except that each occurrence of b in a is duplicated in the new array. You may have to count how many occurrences of b are contained in the array a first.

Expected behaviour:

[14 marks]

(d) The class QuestionOneLauncher (skeleton file supplied) has a single main() method. Inside main(), add calls to each of the methods you have defined in parts (a)—(c) above to test that your implementations produce the correct results. You can write your tests in any way you think appropriate, but you should have at least two tests for each method.

[6 marks]

The files that you must submit for this question are the following:

- (a) OneA.java
- (b) OneB.java
- (c) OneC.java
- (d) QuestionOneLauncher.java

This question focusses on the construction of a circuit simulator containing logic gates. The gates correspond to standard boolean connectives such as NOT, AND and OR.

The circuit simulator is built upon a generic Circuit interface which provides the API for all concrete circuits. Implementing this interface are three classes that can be combined to created larger, more complex circuits. The Input class is the most basic element of a circuit, always outputting the value for which it is set. The SingleInputCircuit class represents a circuit that takes a single output from another circuit, passes this input through a single-input gate, and returns the output from that gate. The DoubleInputCircuit class represents a circuit that takes the output from two other circuits, passes these values through a double-input gate, and returns the output from that gate. The design of the simulator is shown in Figure 1.

You have been provided with the interfaces Circuit and SingleInputGate, and the classes Input, AndGate and DoubleInputCircuit. In addition, a partially implemented CircuitTester is supplied.

You are required to write the interface DoubleInputGate, and the OrGate, NotGate and SingleInputCircuit classes. In addition, you will need to implement some methods in CircuitTester. The task is broken down into more detail below, beginning with the interface SingleInputCircuit.

(a) Write the class NotGate which implements SingleInputGate. This gate must invert its input. That is, a *true* input must return a *false* output, and a *false* input voltage must return a *true* output.

[5 marks]

(b) Write the interface DoubleInputGate. You should be able to infer its methods from Figure 1. In addition, write the class OrGate. This gate's apply() method must return true if either of the inputs is true, otherwise it must return false.

[10 marks]

- (c) Write the class SingleInputCircuit. This task is broken down into more details below:
 - (i) Create instance variables to store the gate that the circuit will be using, and the circuit that this class will be using as input to the gate.
 - (ii) Write the constructor for this class, as specified in Figure 1, so as to initialize the relevant instance variables.
 - (iii) Write the body of the method output(), which takes the output from the sub-circuit, passes it through the gate and returns the output from the gate.

[15 marks]

(d) The class CircuitTester (provided) contains a main() method and a TestAnd() method, along with empty method declarations for TestOr, TestNeg and TestDblNeg. Taking TestAnd as a model, provide bodies for the methods

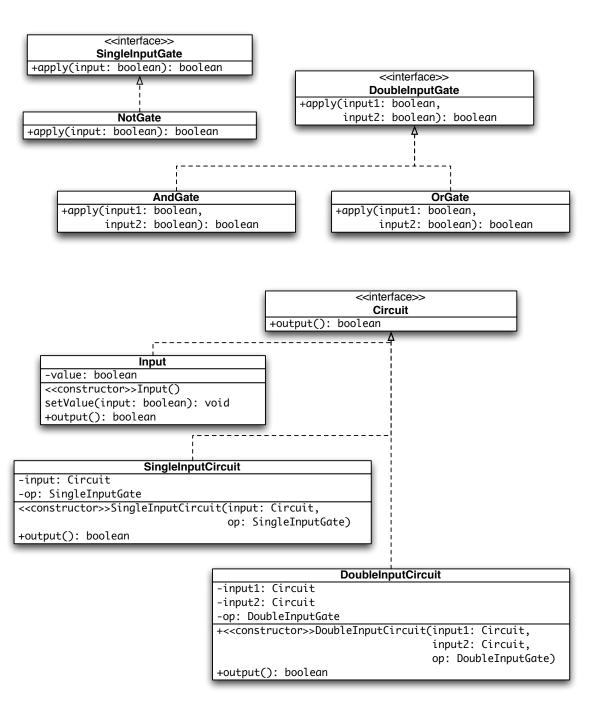

Figure 1: UML Diagram of the Circuit Simulator System

- TestOr;
- TestNeg; and
- TestDblNeg this method should create two SingleInputCircuits that use NotGates, and should use the output from one of the circuits as the input to the other.

[15 marks]

(e) This task involves adding a new method TestXnor() to the class CircuitTester. Use a combination of Circuits and Gates to model a circuit which implements the boolean function XNOR. Here is the truth table for XNOR:

INPUT		OUTPUT
A	B	A XNOR B
0	0	1
0	1	0
1	0	0
1	1	1

[5 marks]

The files that you must submit for this question are the following:

- OrGate.java
- DoubleInputGate.java
- NotGate.java
- SingleInputCircuit.java
- CircuitTester.java

Final Checklist

Here is a complete list of all the files required for this exam:

OneA.java
OneB.java
OneC.java
OneC.java
QuestionOneLauncher.java
OrGate.java
DoubleInputGate.java
NotGate.java
SingleInputCircuit.java
CircuitTester.java
